

Europe Bike Store Sales – Power BI Project Explanation

1. Problem Statement

The Europe Bike Store wants to analyze its sales data to understand overall performance, identify profitable regions and products, and track sales trends over time. The goal is to create an interactive Power BI dashboard that helps management make data-driven business decisions.

2. DAX Formulas Used

- Total Sales = `SUM(Sales[Revenue])`
- Total Profit = `SUM(Sales[Profit])`
- Profit Margin = `DIVIDE([Total Profit], [Total Sales], 0)`
- Total Quantity = `SUM(Sales[Quantity])`
- Average Order Value = `DIVIDE([Total Sales], COUNT(Sales[OrderID]), 0)`

3. Business Insights

- Identified top-performing countries contributing the highest sales revenue.
- Seasonal sales trends show peak demand during specific months.
- Certain bike categories generate high revenue but lower profit margins.
- A small number of products contribute to the majority of profit (Pareto principle).
- Regional analysis helps identify underperforming markets for improvement.

4. Interview Explanation

In interviews, I explain this project as an end-to-end Power BI solution. I started by cleaning and transforming raw sales data using Power Query, ensuring correct data types and removing inconsistencies. I then created DAX measures for key KPIs like Total Sales, Profit, and Profit Margin. After building the data model, I designed an interactive dashboard with slicers, KPIs, and charts to help stakeholders quickly understand business performance and make informed decisions.
